ManageEngine UserConf 2026

Date: February 10 and 11, 2026
Location: The Ritz-Carlton, DIFC in Dubai, UAE

My Experience

This is the 13th edition of ManageEngine UserConf Dubai, their largest annual customer gathering in the UAE, at The Ritz-Carlton, Dubai International Financial Centre (DIFC). ManageEngine is the enterprise IT management division of Zoho Corporation and a leading provider of enterprise IT management solutions/software, with 90+ products and free tools.

The atmosphere at ManageEngine UserConf felt different from other events I had attended before. Rather than focusing on future possibilities alone, many discussions centered on **real-world challenges** that organizations face every day, such as **managing thousands of devices, securing sensitive information, detecting threats, and keeping critical systems running reliably.**

Key Learnings

• **Adoption of AI** is not simply about the models themselves, but rather about the infrastructure, governance, security controls, and monitoring capabilities that have to be in place for autonomous AI to function effectively at scale.

• **Security becomes even more important when AI systems become autonomous**. Learning about agentic AI made me realize the importance of guardrails, oversight, and risk management to ensure that AI systems remain secure and trustworthy.

• **IAM (Identity and Access Management)** is critical to cybersecurity and enterprises must carefully manage who has access to what in their systems in order to minimize risks and vulnerabilities.

• **Enterprise technology is about platforms and not individual products**. I was able to see how companies such as ManageEngine enable enterprises to utilize products that are focused on service management, endpoint management, observability, analytics, security, and automation in an integrated manner.

• **Automation enables enterprises to optimize their processes without compromising on quality**. Numerous functions that were once performed by IT teams are now being automated by intelligent systems, thus enabling them to focus on more high-level tasks.

Speakers

I was especially interested in hearing **Heba Farahat's** talk about **cybersecurity and the dangers that come with using AI.** Hearing the experts talk openly about weaknesses, rules and security steps gave me a better idea of new technologies.

And what I liked the most was that the people speaking did not act like technology can solve all problems. They talked about being dependable keeping things safe and taking things slowly. That truth made the conversations feel more real and helped me understand the duty of making systems that people use every day.

Inspiration and Future Ideas

Of all the conferences I attended, ManageEngine probably gave me the longest list of project ideas.
One concept that particularly stood out to me was ManageEngine's vision of becoming a "platform of platforms." Learning how multiple services, ranging from IT management and identity access management to observability and analytics, could be unified into one ecosystem made me think differently about how large software systems are designed and interconnected.

- Building a lightweight Python **SIEM-style** tool **(Security Information and Event Management)** the program will Read the log files…Extract useful information…Look for unusual patterns… and Generate alerts.
- Creating a **threat-detection dashboard** using **Python data visualization libraries**.
- Investigating how **small AI models compare to larger models in terms of performance, cost as well as resource consumption.**
- Researching **how security guardrails can be implemented to make agentic AI systems safer and more reliable.**

I left the event feeling inspired but also humbled. Seeing the complexity of modern enterprise systems reminded me how much there is still to learn. At the same time, it motivated me to continue developing my programming skills
